

TP5: Land digital Model

Use config of previous practice.

Write a class Terrain that will allow the creation and visualization of a 3D terrain made up of regular triangles. You have the declarations for this class in the downloaded TP5 source code.

1. Creation

Fill up the method `load(char *filename)` of the class `terrain`. Fill up the table "lista_puntos". On the MNT file the terrain is discretized with a point for every 50 meters.

```
MNT 1.0 dep_13 metre 0.01 790000.00(1) 165000.00(2) 50.00(3) -50.00(4) 101(5)
101(6) metre 1
```

- (1) coordenada x en Lambert III de la esquina noroeste
- (2) coordenada y en Lambert III de la esquina noroeste
- (3) distancia entre dos puntos segun X
- (4) distancia entre dos puntos segun Z
- (5) Cantidad de puntos en x
- (6) Cantidad de puntos en z

2. Visualization

Implement the method `display()`. For now it looks like this:

3. Texture

Use the class `TextureManager` to load `fontvieille.tga`.

Fill method `computeTexCoord()` to compute the texture coords.

Modify `display()` method to so now uses the loaded texture.

4. Calculate normals.

The terrain is not correctly illuminated. We need to specify the normals for every triangle but we want a smooth surface so instead specify a normal for every vertex.
